

ABSTRACT OF THE DISCLOSURE

A cabinet scraper that protects the scraper blade from damage due to contact with the body of the scraper and that protects the user from contact with the upper end of the blade, preferably by including a portion of the body that extends beyond the upper end of the blade. The blade is held in place by a clamp bar, and the shape of the blade may be modified using an adjustment screw. Preferably, the clamp bar includes a chamfer along an edge, so that shavings produced during scraping do not bunch up between the blade and body of the scraper.
